

Untitled

Markdown allows you to format text with *emphasis* and **strong emphasis**.

You can also add superscripts², subscripts₂, and display code `verbatim`.

Little known fact: you can also ~~striketrough~~ text and present it in SMALL CAPS.

There is also **highlighted text** and Underlined Text.

For Creating accessible PDFs you still need Alt text for every image, specified with `fig-alt`.

```
{fig-alt="A drawing of an elephant."}
```

or multiple params

```
{fig-alt="A drawing of an elephant." fig-align="left" width=20%}
```

To render the caption instead as alt text you can append a backslash to the line as detailed in the Pandoc documentation:

```
![A drawing of an elephant.](elephant.png)\
```

Only work for HTML

For red text with yellow highlight: red and yellow.

You can create custom classes or use Bootstrap classes (if rendering to HTML) to style text:

- Text Colors (HTML): Text in red or Text in blue.
- Background Colors (HTML): Highlighted.
- Custom Class: Custom text (Requires defining `.my-custom-class` in a custom CSS file).

Pandoc's Fenced Code Block

Sandwich the code between “fences” of at least three backticks! An optional language provides syntax highlighting.

```
x <- c(1,100,10)
library(ggplot2)
plot(x, col="red")
```

Useful for displaying source code, not running it Note that the language is not in { }

Block Elements: Lists (example lists) The first list item with a @ marker will be numbered 1., the next 2., etc. The numbered examples need not occur in a single list; each new list using @ will take up where the last stopped. - the Pandoc Docs

- (1) The first example.
- (2) The second example.

Explanation of examples.

- (3) The third example.

You can also label your examples: (@goodname).

The Fenced Div
